

A photograph of a beach heavily littered with plastic waste and seaweed. In the foreground, there is a large white plastic jug, a blue plastic container, and various pieces of debris. The middle ground shows a dense layer of brown seaweed and more trash. In the background, there are several palm trees and the ocean with waves breaking on the shore under a clear blue sky.

Three divers return to shore without treasures

Sinopsis

Three tired divers arrive on shore without treasures. They have found trash and plastics of all kinds. Upon discovering all this garbage, something surprising will happen.

The sea pollution comes to life.

Descripción

Three divers in 1880s diving suits and helmets arrive in the city center. They are treasure hunters dragging nets filled with plastics and garbage. They have had no luck, times have changed. Their diving helmets are illuminated and if you approach them, you can hear the sound of the ocean floor. Upon reviewing these waste remains, a small creature will come to life and guided by these three divers, it will find its place among the people and children of the city. Scuba is a show with a direct message to spectators of all ages about the problem of pollution in our planet's seas and rivers.

Every second, more than 200 kilograms of plastic are thrown into the seas and oceans. 70% goes to the ocean floor and 15% stays afloat.

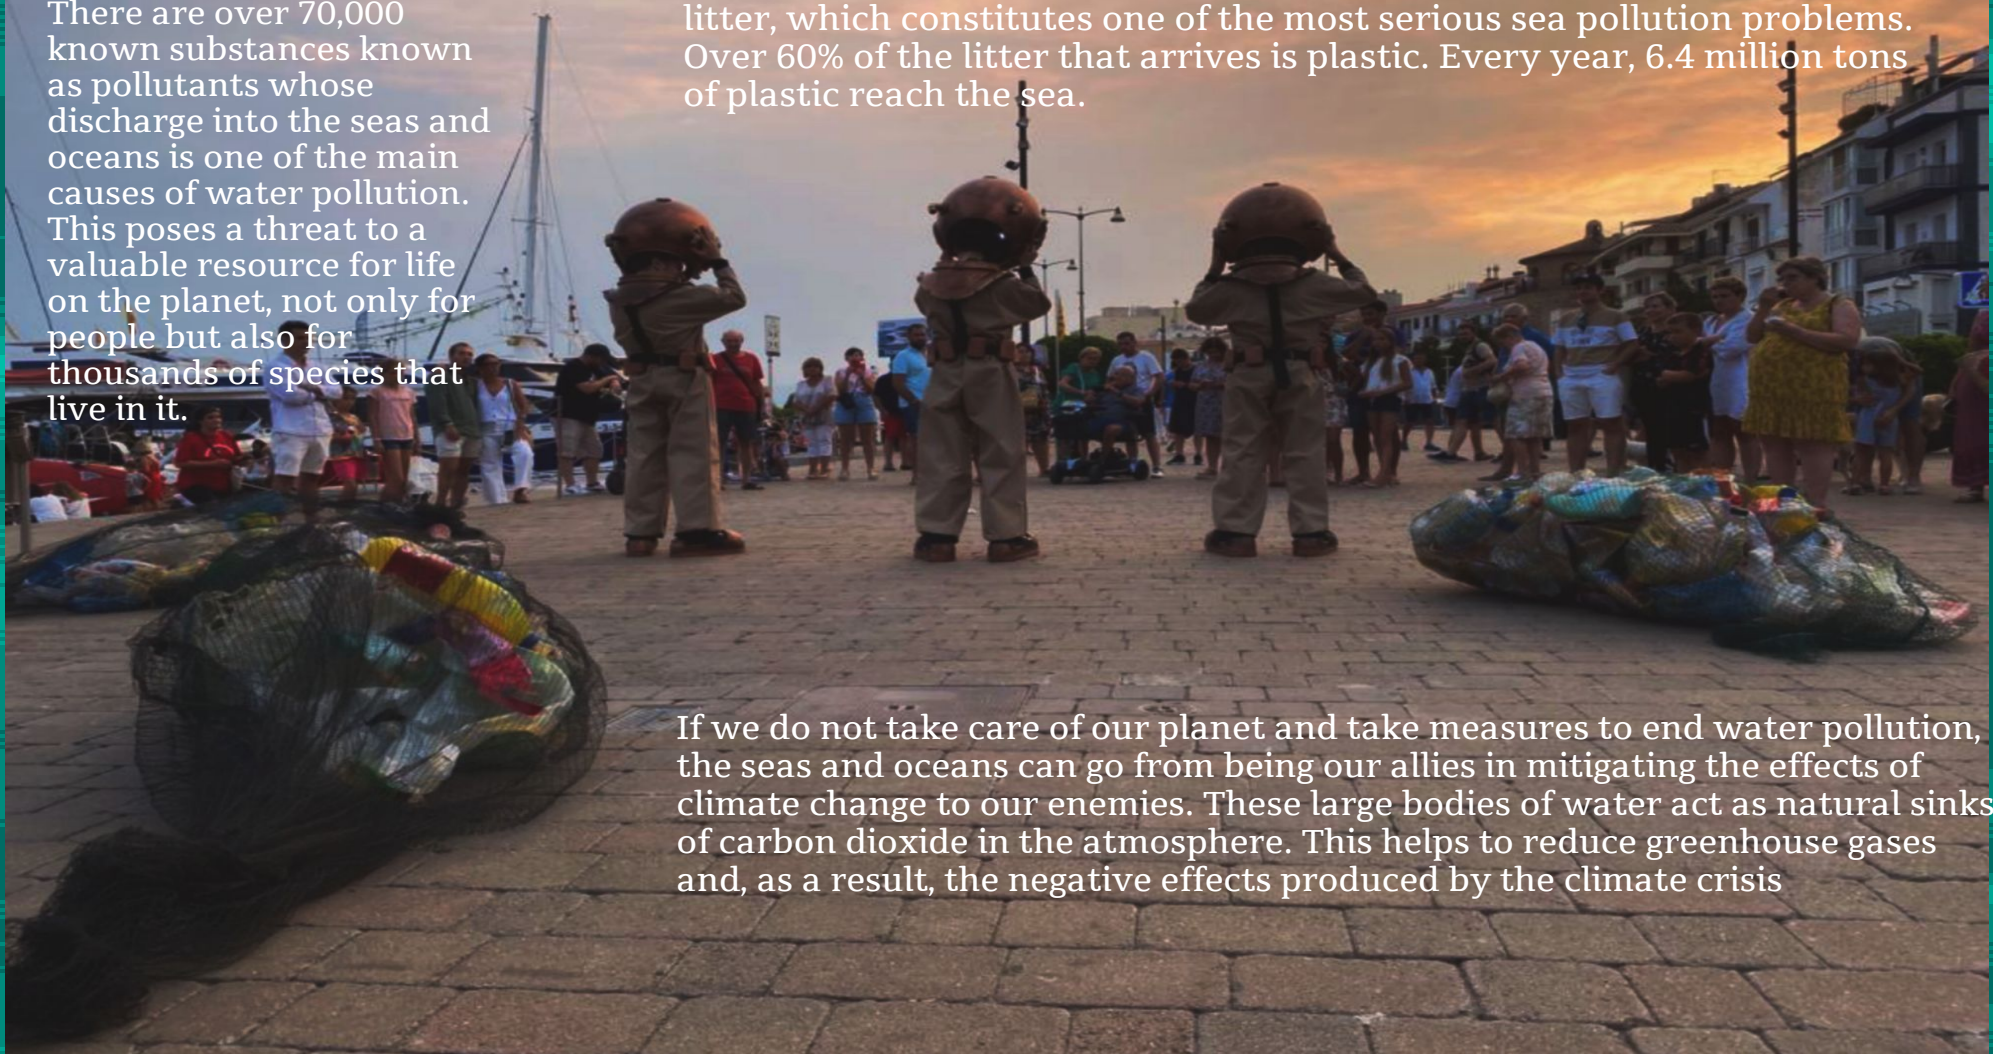

Some data

There are over 70,000 known substances known as pollutants whose discharge into the seas and oceans is one of the main causes of water pollution. This poses a threat to a valuable resource for life on the planet, not only for people but also for thousands of species that live in it.

The most polluted sea is the Mediterranean. The coasts of France, Spain and Italy are the most polluted in the world. Next on the list are the Caribbean Sea, the Celtic Sea, and the North Sea. The cause? Marine litter, which constitutes one of the most serious sea pollution problems. Over 60% of the litter that arrives is plastic. Every year, 6.4 million tons of plastic reach the sea.

If we do not take care of our planet and take measures to end water pollution, the seas and oceans can go from being our allies in mitigating the effects of climate change to our enemies. These large bodies of water act as natural sinks of carbon dioxide in the atmosphere. This helps to reduce greenhouse gases and, as a result, the negative effects produced by the climate crisis

Insolits performing Arts

Eight Million metric tons: is the amount of plastic that we throw into the oceans every year. Equivalent to nearly 57,000 blue whales per year.

By 2050, there will be more plastic than fish in the oceans.
